OpenCL (Open Computing Language) is a multi-vendor open standard for general-purpose parallel programming of heterogeneous systems that include CPUs, GPUs, and other processors. OpenCL provides a uniform programming environment for software developers to write efficient, portable code for high-performance compute servers, desktop computer systems, and handheld devices. Specifications and online reference available at **www.khronos.org/opencl**.

OpenCL Class Diagram

The figure below describes the OpenCL specification as a class diagram using the Unified Modeling Language[1] (UML) notation. The diagram shows both nodes and edges which are classes and their relationships. As a simplification it shows only classes, and no attributes or operations.

Annotations	
Relationships	
abstract classes	{abstract}
aggregations	♦
inheritance	△
relationship navigability	^
Cardinality	
many	*
one and only one	1
optionally one	0..1
one or more	1..*

OpenCL Device Architecture Diagram

The table below shows memory regions with allocation and memory access capabilities. R=Read, W=Write

	Host	Kernel
Global	Dynamic allocation R/W access	No allocation R/W access
Constant	Dynamic allocation R/W access	Static allocation R-only access
Local	Dynamic allocation No access	Static allocation R/W access
Private	No allocation No access	Static allocation R/W access

This conceptual OpenCL device architecture diagram shows processing elements (PE), compute units (CU), and devices. The host is not shown.

Atomic Functions [6.13.11]

OpenCL C implements a subset of the C11 atomics (see 7.17 of the C11 spec.) and synchronization operations.

Atomic Functions

In the following definitions, **A** refers to one of the atomic_* types. **C** refers to its corresponding non-atomic type. **M** refers to the type of the other argument for arithmetic operations. For atomic integer types, **M** is **C**. For atomic pointer types, **M** is ptrdiff_t. The type atomic_* is a 32-bit integer. atomic_long and atomic_ulong require extension cl_khr_int64_base_atomics or cl_khr_int64_extended_atomics. The atomic_double type requires double precision support. The default scope is work_group for local atomics and all_svm_devices for global atomics.

See the table under Atomic Types and Enum Constants for information about parameter types memory_order, memory_scope, and memory_flag.

void **atomic_init**(volatile A *_obj_, C _value_)	Initializes the atomic object pointed to by _obj_ to the value _value_.
void **atomic_work_item_fence**(cl_mem_fence_flags _flags_, memory_order _order_, memory_scope _scope_)	Effects based on value of _order_. _flags_ must be CLK_{GLOBAL, LOCAL, IMAGE}_MEM_FENCE or a combination of these.
void **atomic_store**(volatile A *_object_, C _desired_) void **atomic_store_explicit**(volatile A *_object_, C _desired_, memory_order _order_[, memory_scope _scope_])	Atomically replace the value pointed to by _object_ with the value of _desired_. Memory is affected according to the value of _order_.
C **atomic_load**(volatile A *_object_) C **atomic_load_explicit**(volatile A *_object_, memory_order _order_[, memory_scope _scope_])	Atomically returns the value pointed to by _object_. Memory is affected according to the value of _order_.
C **atomic_exchange**(volatile A *_object_, C _desired_) C **atomic_exchange_explicit**(volatile A *_object_, C _desired_, memory_order _order_[, memory_scope _scope_])	Atomically replace the value pointed to by _object_ with _desired_. Memory is affected according to the value of _order_.
bool **atomic_compare_exchange_strong**(volatile A *_object_, C *_expected_, C _desired_) bool **atomic_compare_exchange_strong_explicit**(volatile A *_object_, C *_expected_, C _desired_, memory_order _success_, memory_order _failure_[, memory_scope _scope_]) bool **atomic_compare_exchange_weak**(volatile A *_object_, C *_expected_, C _desired_) bool **atomic_compare_exchange_weak_explicit**(volatile A *_object_, C *_expected_, C _desired_, memory_order _success_, memory_order _failure_[, memory_scope _scope_])	Atomically compares the value pointed to by _object_ for equality with that in _expected_, and if true, replaces the value pointed to by _object_ with _desired_, and if false, updates the value in _expected_ with the value pointed to by _object_. Further, if the comparison is true, memory is affected according to the value of success, and if the comparison is false, memory is affected according to the value of failure. These operations are atomic read-modify-write operations.
C **atomic_fetch_<_key_>**(volatile A *_object_, M _operand_) C **atomic_fetch_<_key_>_explicit**(volatile A *_object_, M _operand_, memory_order _order_[, memory_scope _scope_])	Atomically replaces the value pointed to by _object_ with the result of the computation applied to the value pointed to by _object_ and the given _operand_. Memory is affected according to the value of _order_. <_key_> is to be defined.
bool **atomic_flag_test_and_set**(volatile atomic_flag *_object_) bool **atomic_flag_test_and_set_explicit**(volatile atomic_flag *_object_, memory_order _order_[, memory_scope _scope_])	Atomically sets the value pointed to by _object_ to true. Memory is affected according to the value of _order_. Returns atomically, the value of the object immediately before the effects.
void **atomic_flag_clear**(volatile atomic_flag *_object_) void **atomic_flag_clear_explicit**(volatile atomic_flag *_object_, memory_order _order_[, memory_scope _scope_])	Atomically sets the value pointed to by _object_ to false. The order argument shall not be _memory_order_acquire_ nor _memory_order_acq_rel_. Memory is affected according to the value of _order_.

int **printf** (constant char * restrict _format_, ...)

printf output synchronization

When the event associated with a particular kernel invocation completes, the output of applicable **printf** calls is flushed to the implementation-defined output stream.

%[_flags_][_width_][.*precision*][_vector_][_length_] _conversion_

Examples:

The following examples show the use of the vector specifier in the **printf** format string.

```
float4 f = (float4)(1.0f, 2.0f, 3.0f, 4.0f);
printf("f4 = %2.2v4f\n", f);
    Output: f4 = 1.00,2.00,3.00,4.00

uchar4 uc = (uchar4)(0xFA, 0xFB, 0xFC, 0xFD);
printf("uc = %#v4x\n", uc);
    Output: uc = 0xfa,0xfb,0xfc,0xfd

uint2 ui = (uint2)(0x12345678, 0x87654321);

Enqueing and Kernel Query Built-in Functions [6.13.17] [9.17.3.6]

A kernel may enqueue code represented by Block syntax, and control execution order with event dependencies including user events and markers. There are several advantages to using the Block syntax: it is more compact; it does not require a cl_kernel object; and enqueuing can be done as a single semantic step. Sub-groups require the cl_khr_subgroups extension. The macro CLK_NULL_EVENT refers to an invalid device event. The macro CLK_NULL_QUEUE refers to an invalid device queue.

int **enqueue_kernel** (queue_t *queue*, kernel_enqueue_flags_t *flags*, const ndrange_t *ndrange*, void (^*block*)(void)) int **enqueue_kernel** (queue_t *queue*, kernel_enqueue_flags_t *flags*, const ndrange_t *ndrange*, uint *num_events_in_wait_list*, const clk_event_t *event_wait_list, clk_event_t *event_ret, void (^*block*)(void)) int **enqueue_kernel** (queue_t *queue*, kernel_enqueue_flags_t *flags*, const ndrange_t *ndrange*, void (^*block*)(local void *, ...), uint size0, ...) int **enqueue_kernel** (queue_t *queue*, kernel_ enqueue_flags_t *flags*, const ndrange_t *ndrange*, uint *num_events_in_wait_list*, const clk_event_t *event_wait_list, clk_event_t *event_ret, void (^*block*)(local void *, ...), uint size0, ...)	Allows a work-item to enqueue a block for execution to *queue*. Work-items can enqueue multiple blocks to a device queue(s). *flags* may be one of CLK_ENQUEUE_FLAGS_{NO_WAIT, WAIT_KERNEL, WAIT_WORK_GROUP}

Image Read and Write Functions [6.13.14]

The built-in functions defined in this section can only be used with image memory objects created with **clCreateImage**. *sampler* specifies the addressing and filtering mode to use. MSAA images require the cl_khr_gl_msaa_sharing extension, and image 3D writes require the extension cl_khr_3d_image_writes.

OpenCL Extensions Reference

Using OpenCL Extensions [9]

The following extensions extend the OpenCL API.

To control an extension: #pragma OPENCL EXTENSION *extension_name* : {enable | disable}

To test if an extension is supported:

To get the address of the extension function:
